2. Measurements of ejection fraction. The most appropriate method for measurement of left ventricular ejection fraction (LVEF) in the clinical setting is still being debated. Ejection fraction determined by gated single photon emission computed tomography (SPECT) is one of the most frequently used methods.

It is based on comparison of the left ventricular count (C) to count per heart cycle (H) (C/H) ratio obtained from rest and exercise SPECT, and on dividing it by the rest C/H ratio to estimate the exercise-induced change. The exercise LVEF is considered to be accurate provided C/H is within the range of 1.0-2.0 and the errors of C/H are
