One of the newer formats is Ansi. This version is compatible with as long as you know the tricks to make it work. Otherwise you'll need a hex editor. In order to encode with this format, you must open the file with Notepad or any of the hex editors that have this format. After the file is open, the page will look like this... If you look to the top right of the page, the bit pattern for the characters and colors will show. The first step to encoding in this new format is to make sure your file is well structured. If the file is not formatted properly and has both codes embedded in it, it will become a chore to find the codes. If the format of the file is proper, you can use a simple notation for the codes. The VB code is above the lines of text. The BOM is between the lines of code. Going top to bottom and left to right from the top of the page, you need to move to the next line. The next step is to look for the NULL character(0x28). This is the reason why you want to make sure the file is properly formatted. The NULL character is used to separate the numbers from the text. It is also used to end the text file. If you look at the left edge of the NULL character, you will see a single dot. This dot tells you to move to the next line. Using the same method, move back to the right edge of the NULL character, to find a single dot again. This dot tells you to go to the next row. As you can see, the codes are very similar to ANSI. It is just the way the codes are written out. As of August 25th, 2010, this software will work on Windows Vista, Windows 7, and Windows 8. It will work on Mac OS X 10.6.8 and later. I have tested it on Windows 7, Windows 8, and Mac OS X 10.6.8 and later. The software was built for use with a fixed video mode using progressive scan and 200Hz refresh rate at 72dpi. For a more advanced user there is a way to see the character codes. This is done by having your screen in another program and in the debug mode of the program with which the game is being played. For example, you could open
