The features in Photoshop are not exactly new, but they are so well integrated into the program and are so wide-spread that creating a Photoshop document can be a bit daunting. For beginner users, I have an outline of the basic tools to help you out. As you master the program and master Photoshop's features, the rest will fall into place. For this article, I have compiled a list of over 38 basic features that I use every day as a Photoshop user. Have a look for yourself and bookmark this page. If you know of any other Photoshop basics that I might have forgotten or skipped, please add them to the list, or do a comment below and let me know so that I can add it in! 1. New File Create a new document in Photoshop. 2. Open Use a file browser to open a new file. You can also save a new file by clicking File on the main menu bar and pressing the Save button. 3. Save Your work If you are finished with a document, save the file by clicking File > Save, or pressing Ctrl + S on your keyboard. 4. Close Save a document when you're done working. Close the document by clicking File > Close. 5. Import Open an image by selecting File > Import. 6. Preview Import a file into Photoshop. You can also see a preview of the image by pressing F12. 7. Align To line up the edges of an image, just click along the line where the edges meet. After clicking, Photoshop will align the edges of the image. If you try this with moving the image from one place to another, a nice arrow will pop up to help you. 8. Spot Healing The Spot Healing tool allows you to easily and accurately select and delete a small, selected area of an image. Simply click and select the area that you wish to fix. The white arrow will appear surrounding the selection area. Click and drag around the area to delete the unwanted parts of the image. 9. Rotate Select an area to rotate an image. To rotate the image, click and drag on an area of the image. 10. Mirror To flip an image horizontally or vertically, click and drag on the top half of the image, or the bottom half, and Photoshop will automatically flip the image. 11. Adjust Color To brighten or darken an image, click on the yellow triangle along the bottom of the

Cryptography is a set of mathematical techniques used to protect sensitive information by scrambling it into a form that can be opened only by specific authorized parties. There are many protocols and methods of encryption employed in this day and age; the earliest development of cryptology can be traced to several historic incidents. Written history is separated from the invention of cryptography by about 5000 years (see History of cryptography). The earliest recorded accounts of cryptography appeared in the writings of the Mayans. The Maya used numerous forms of cryptography, but most notable was the Serpent and Calendar used for enciphering messages written on wooden tablets. Arguably the first recorded instance of cryptography was an anecdote of a secret messsage by Philo of Byblos in BC 300. Philo's metaphor was a secret message wrapped in a brick; his method of decoding the message was the knotted path of the paper rope's knot. The Chinese enigma cipher had been around since before the creation of any written history. The earliest known example of the Chinese cipher is the 11th century Book of the Cangshu, or Cang-shu, which contained a message in the form of a story, broken up into 1000 characters. The story is keyed to the right page number, and the characters use a 10-character ideographic alphabet. By AD 800, the Chinese were using a shift cipher and a simple substitution cipher using Greek letters. Around 1000, the Chinese used a more advanced cipher using Greek letters, Roman numerals, and Chinese characters. This system only allowed single-byte substitutions, and still had the weakness of using alphabetic characters in its underlying shift cipher. In addition, the substitution was done so that the characters in plaintext were normally a complete word, although the number of characters were significantly reduced. Around 1200, the Chinese employed a form of transposition cipher which can be considered the precursor of the modern day block cipher. During the Yuan dynasty (AD 1271-1368), the Chinese began using multiple ciphertexts, which were an essential part of cryptography in the process of solving Chinese mnemonic puzzles. In addition to ciphers, the Chinese also employed other devices to protect their secrets, such as a writing brush with a locking device on the handle, a covered box with a lock, and a seal. One of the Chinese ciphers, the Cang-shu cipher, had a use as a form of word association. The text of the secret message 05a79cecff

the conference. An American Unionist in Dublin believed that he could get his country to give up their empire if the British would declare independence from the United States. He wrote to Jefferson about his dream for Ireland, which he saw as the key to his plan for a world without empires. His name is unknown, but he is considered by many historians as the author of the document "America, the Cause of Europe's Ruin: Or, A Plan for the Restoration of Continental Europe to its Ancient Liberty, Independence, and Constitution, by the Removal of the British Dynasty from the Throne of Great Britain." Philadelphia While all of these men showed remarkable foresight, they were not the first to try to reach their goals. The back and forth argument between nationalists and Unionists began immediately after the war ended and continued long after the Constitutional Convention and the first president. Even today we still find people in favor of either side making or calling for a violent overthrow of the government. It was too late for them to realize that the U.S. is and always will be a nation created by the men of the 1776 draft and ratification. We may not always do what is right or best for our country, but our hands are tied. Thomas Paine put it best in his pamphlet "Common Sense": What has America done for Ireland? She has shown the World that the strength of moral principle and the love of liberty can triumph over the violence and injustice of a powerful faction. She has proved that nothing can be resolved by force; and that, even where the government is bad, the love of its people are good. How many would like to live in a country where a powerful faction can force the government to do something it doesn't want to? The good news is that there is nothing to stop the U.S. from doing what is right; all it would take is for people to take another look at their country's history. We can start by following Thomas Paine's advice and look at our country's past for guidance. Ethan Hansen is a writer, a homeschooling dad, and a passionate Christian. Q: Printing the div tag to a PDF with AJAX in ASP.NET using C# I have an ASP.NET application. I have a HTML page which has a lot of tags within it. When I click a button it should go to a PDF printer. I did a research and understood that I can use an AJAX file to get the HTML content of the page and print it. I have already tried like below: AJAX content save to the text file. Then I am using the command line to print the file. I used a JQuery function $.get and append to an existing table the function draws the HTML table. But, either the second or third option didn't work. My problem is that once I click the Print button on the ASP.NET application it directly goes to a login page. After I am authenticated it goes to the PDF printer. But that too is very slow. I want my print function to run automatically after the button is clicked. Is there a way I can do that? I would really appreciate any guidance.
